## Problem description

## Dynamical systems approach and results

## Poincaré Maps

## Regular regions and Lyapunov exponents

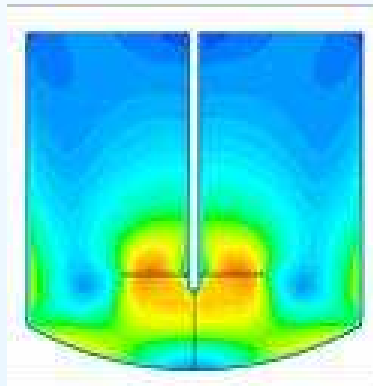

## Critical points

## Streamlines and trajectories

## Comparison of $B_2$ and $B_3$

## Conclusions and outlook

- Fluid mixing efficiency is a crucial issue in many engineering applications
- Efficient mixing is usually related to turbulent regimes and to mechanical devices

- Some industrial applications require an efficient mixing in the absence of turbulence or high shear stresses
- Rayleigh–Bénard convection can offer an alternative to the use of mechanical devices

# Objectives

## Problem description

## Dynamical systems approach and results

## Poincaré Maps

## Regular regions and Lyapunov exponents

## Critical points

## Streamlines and trajectories

## Comparison of $B_2$ and $B_3$

## Conclusions and outlook

The design of reactors in which **efficient mixing** is achieved without moving parts

The application of **dynamical systems theory** to the analysis of dynamics and mixing properties in flows induced by Rayleigh–Bénard convection inside a cube

- Analyze the rich dynamics of fluid particle trajectories
- Characterize well-mixed regions inside the cube
- Investigate the dependence of mixing properties on the Rayleigh number

Critical points

Streamlines and trajectories

Comparison of  $B_2$  and  $B_3$

Conclusions and outlook

$$Ra = g\beta L^3 \Delta T / \alpha \nu$$

$$Pr = \nu / \alpha$$

$\beta$  thermal expansion

$\nu$  kinematic viscosity

$\alpha$  thermal diffusivity

$$\Delta T = T_h - T_c$$

$$\theta = [T - (T_h + T_c)/2] / \Delta T - z$$

## Continuity

$$\nabla \cdot \vec{V} = 0$$

## Momentum

$$\frac{1}{Pr} \left( \frac{\partial \vec{V}}{\partial t} + Ra^{\frac{1}{2}} (\vec{V} \cdot \nabla) \vec{V} \right) = \nabla^2 \vec{V} + Ra^{\frac{1}{2}} \theta \vec{e}_z - \nabla p$$

## Energy

$$\frac{\partial \theta}{\partial t} + Ra^{\frac{1}{2}} (\vec{V} \cdot \nabla) \theta = \nabla^2 \theta + Ra^{\frac{1}{2}} \vec{V} \cdot \vec{e}_z$$

## Boundary conditions

$$\vec{V} = \theta = 0 \text{ en } \partial\Omega$$

Conclusions and outlook

$V_c$  = volume occupied by the chaotic zone (points outside invariant tori)

## Computation Procedure

- Divide the cavity into  $n \times n \times n$  cubic cells ( $n = 200$ )
- Compute trajectories of fluid particles initially located at  $x_0$ , for any  $x_0$  in the set  $C_I$  (final time  $t_M = 10^6$ )
 
$$C_I = \left\{ \left( -0.375 + \frac{i}{8}, 0.48, -0.375 + \frac{j}{8} \right), i, j = 0, \dots, 6 \right\}$$
- Store the cells visited by one or more trajectories
- $N_r(t)$  = number of cells that at time  $t$  have not yet been visited by any particle trajectory (every  $\Delta t = 200$ )
- Check that  $N_r(t)$  is almost constant in  $t \in [\frac{3}{4}t_M, t_M]$
- Points at a distance less than 0.01 from the boundaries are considered as non-regular

Critical points

Streamlines and trajectories

Comparison of  $B_2$  and  $B_3$

Conclusions and outlook

$$L_M(x_0) = \lim_{t \rightarrow \infty} \frac{1}{t} \log \left( \frac{\|l_t\|}{\|l_0\|} \right)$$

$l_t = D_x \phi(t, x_0) l_0$  where  $l_0$  is an arbitrary vector and  $\phi(t, x_0)$  is a solution of the differential equation with  $\phi(0, x_0) = x_0$

## Computation Procedure

- 49 equidistributed initial conditions on the plane  $y = 0.48$
- finite time approximations of  $L_M$  (final time= $10^5$ )
- transient values ( $t \leq 10^4$ )
- calculate  $\log(\|l_t\| / \|l_0\|) / t$  every  $10^3$  units of time after the transient ( $t > 10^4$ )
- average with respect to time and initial conditions

Streamlines and trajectories

Comparison of  $B_2$  and  $B_3$

Conclusions and outlook

## Poincaré–Hopf index theorem

The sum of the Poincaré indexes over all the isolated critical points of a vector field on a compact orientable differentiable manifold is equal to the Euler characteristic of the manifold

### Change from the cubical domain to the 3D sphere $\mathbb{S}^3$

- the interior of the cubical domain is topologically equivalent to a 3D open ball  $B^3$  and its boundary is equivalent to a 2D sphere  $\mathbb{S}^2$
- deform  $B^3$  to get a 3D hemisphere whose equator is  $\mathbb{S}^2$
- take a symmetric copy of the 3D hemisphere and glue both hemispheres after identifying the  $\mathbb{S}^2$  boundaries

The Poincaré index of a critical point  $x_c$  satisfying  $Re\lambda_i \neq 0$ , is  $(-1)^{n_p}$ , where  $n_p = \#\{\lambda_i \mid Re\lambda_i < 0, i = 1, 2, 3\}$ . Interior critical points must be counted **twice**.

Conclusions and outlook

- Conclusions
- Outlook

- The dynamics are characterized by regions with regular motion surrounded by regions of chaotic motion
- Changes on the topology and on the chaotic level of the flows are related to bifurcations of critical points
- The detailed knowledge of the flow provided by the dynamical systems approach can be relevant in selecting the parameter ranges and flow patterns at which more efficient mixing is achieved
